

HOTEL MANAGEMENT SYSTEM

IT8511-Web technology Laboratory -Mini Project

**Done by,
Dhivya B S -18IT06**

Aim:

To design hotel management system using HTML, CSS, JavaScript, Bootstrap, Php, and MySQL.

Concepts Involved:**HTML:**

- HTML stands for Hyper Text Markup Language
- HTML is the standard markup language for creating Web pages
- HTML describes the structure of a Web page
- HTML consists of a series of elements
- HTML elements tell the browser how to display the content

CSS:

- **CSS** stands for **Cascading Style Sheets**
- CSS describes **how HTML elements are to be displayed on screen, paper, or in other media**
- **CSS saves a lot of work.** It can control the layout of multiple web pages all at once
- External stylesheets are stored in **CSS files**

JAVASCRIPT:

JavaScript is a scripting or programming language that allows you to implement complex features on web pages — every time a web page does more than just sit there and display static information for you to look at — displaying timely content updates, interactive maps, animated 2D/3D graphics, scrolling video jukeboxes, etc. — you can bet that JavaScript is probably involved.

BOOTSTRAP:

Bootstrap is a giant collection of handy, reusable bits of code written in HTML, CSS, and JavaScript. It's also a front-end development framework that enables developers & designers to quickly build fully responsive websites.

PHP:

- PHP is an acronym for "PHP: Hypertext Preprocessor"
- PHP is a widely-used, open source scripting language
- PHP scripts are executed on the server
- PHP can generate dynamic page content
- PHP can create, open, read, write, delete, and close files on the server
- PHP can collect form data
- PHP can send and receive cookies
- PHP can add, delete, modify data in your database
- PHP can be used to control user-access
- PHP can encrypt data

Modules used:

I. Admin Module:

1.Admin Login:

Input: Admin needs to login using email id and password.

Output: After successful login, Admin views the Admin Page.

2.Admin Page:

Input: Admin select which section to view

Output: User's Booking records of Room, Party hall, dinning table are shown. Admin can also delete the records. After clicking logout, it takes back to the login page.

II. User Module:

1.Signup:

Input: User needs to register using email id and password ,or using Facebook, twitter or google account. After successful registration, login page is shown to the user.

Output: After successful login, user views the homepage from where user can book rooms, party hall or dinning.

2.HomePage:

Input: From the menu bar, user can select which **section** (home, about, booking, recipes , lifestyle ,contact) to view

Output: Based on user's selection, the section is shown to the user

3.Booking:

a)Room Booking:

Input: Room registration form is shown to the user

Output: Once all the details are filled, Room is registered successfully.

b) Party hall Booking:

Input: Party hall registration form is shown to the user

Output: Once all the details are filled, Party hall is registered successfully.

c) Table Booking:

Input: Table booking registration form is shown to the user

Output: Once all the details are filled, Table is registered successfully.

4. Bill generation:

Input: User Clicks the Breakfast, Lunch, or Breakfast Pack.

Output: Bill is generated which the user can print.

5. Queries:

Input: A chatbot asks for queries from the user.

Output: The user can enter the queries in the chat window.

PROGRAM:

USER MODULE:

home.php:

```
<?php
    session_start();
?>
