

HOTEL MANAGEMENT SYSTEM

IT8511-Web technology Laboratory -Mini Project

**Done by,
Dhivya B S -18IT06**

Introduction:

In this phase, we have designed the front end of hotel management website using HTML, CSS, JavaScript, Bootstrap

HTML:

- HTML stands for Hyper Text Markup Language
- HTML is the standard markup language for creating Web pages
- HTML describes the structure of a Web page
- HTML consists of a series of elements
- HTML elements tell the browser how to display the content

CSS:

- **CSS** stands for **Cascading Style Sheets**
- CSS describes **how HTML elements are to be displayed on screen, paper, or in other media**
- **CSS saves a lot of work.** It can control the layout of multiple web pages all at once
- External stylesheets are stored in **CSS files**

JAVASCRIPT:

JavaScript is a scripting or programming language that allows you to implement complex features on web pages — every time a web page does more than just sit there and display static information for you to look at — displaying timely content updates, interactive maps, animated 2D/3D graphics, scrolling video jukeboxes, etc. — you can bet that JavaScript is probably involved.

BOOTSTRAP:

Bootstrap is a giant collection of handy, reusable bits of code written in HTML, CSS, and JavaScript. It's also a front-end development framework that enables developers & designers to quickly build fully responsive websites.

Modules used:

1.HomePage:

Input: From the menu bar, user can select which **section** (home, about, booking, recipes , lifestyle ,contact) to view

Output: Based on user's selection, the section is shown to the user

2.Signup:

Input: User needs to register using email id and password ,or using Facebook, twitter or google account. After successful registration, login page is shown to the user.

Output: After successful login, user views the homepage from where user can book rooms, party hall or dinning.

3.Booking:

a)Room Booking:

Input: Room registration form is shown to the user

Output: Once all the details are filled, user can Pay online by clicking Pay Now button

b) Party hall Booking:

Input: Party hall registration form is shown to the user

Output: Once all the details are filled, user can Pay online by clicking Pay Now button

c)Table Booking:

Input: Table booking registration form is shown to the user

Output: Once all the details are filled, user can Pay online by clicking Pay Now button

4.Payment:

Input: Users give their credit/debit card details.

Output: The transaction process is made successfully.

5.Feedback:

Input: A chatbot asks for feedback from the user

Output: The user can enter the feedback in the chat window

PROGRAM:

home.html:

```

On clicking recipes in menu , it takes to this.

On hovering over the dishes, its faded like this.

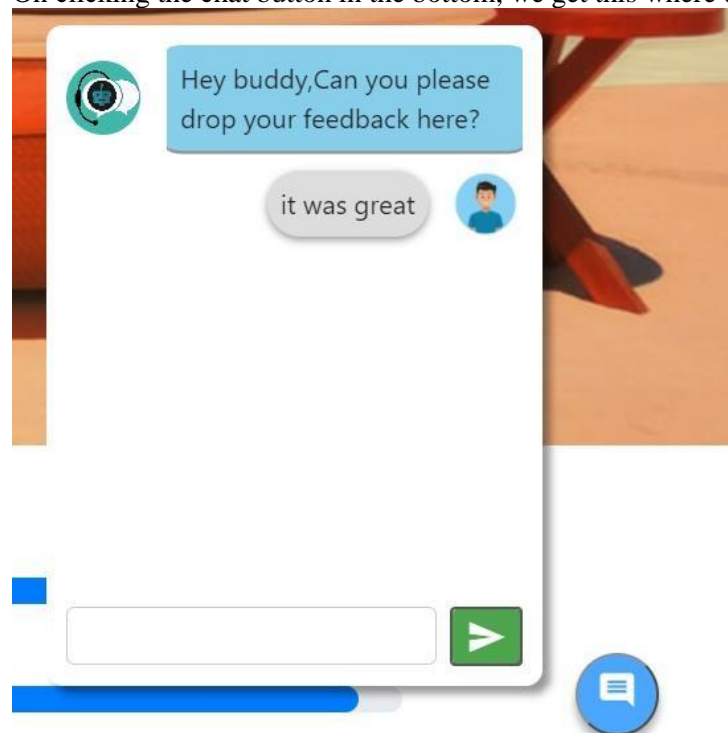

On clicking lifestyle it takes to the following section.

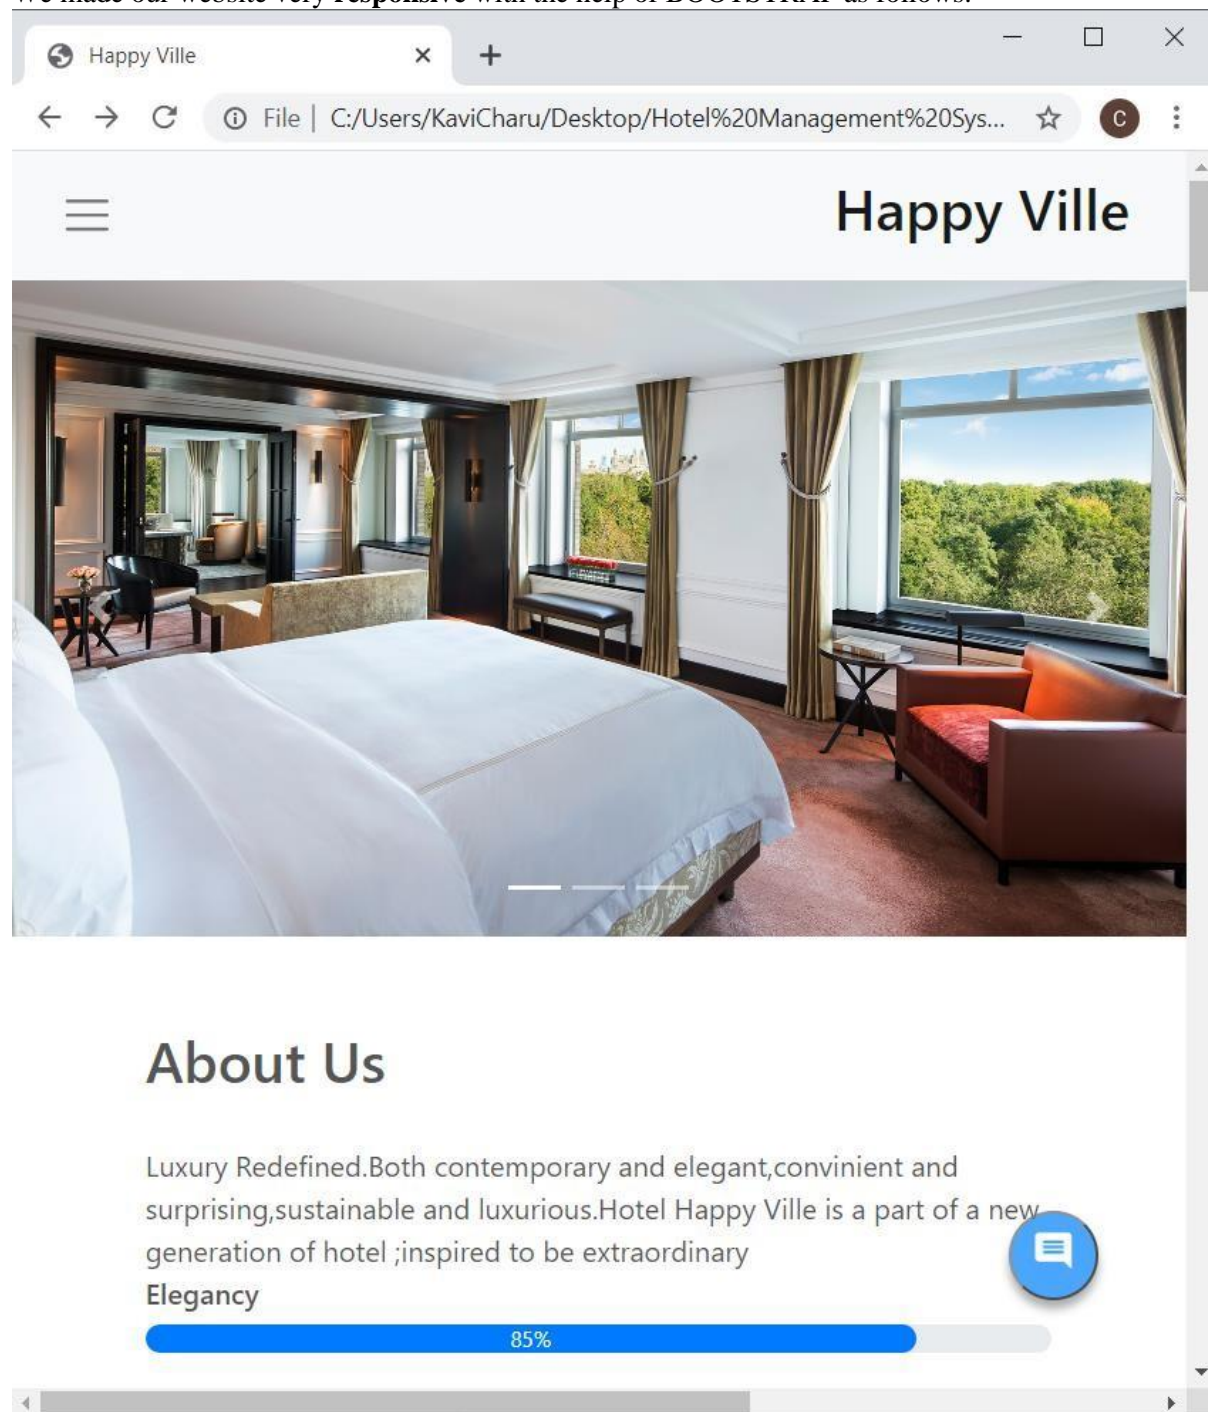

Feedback:

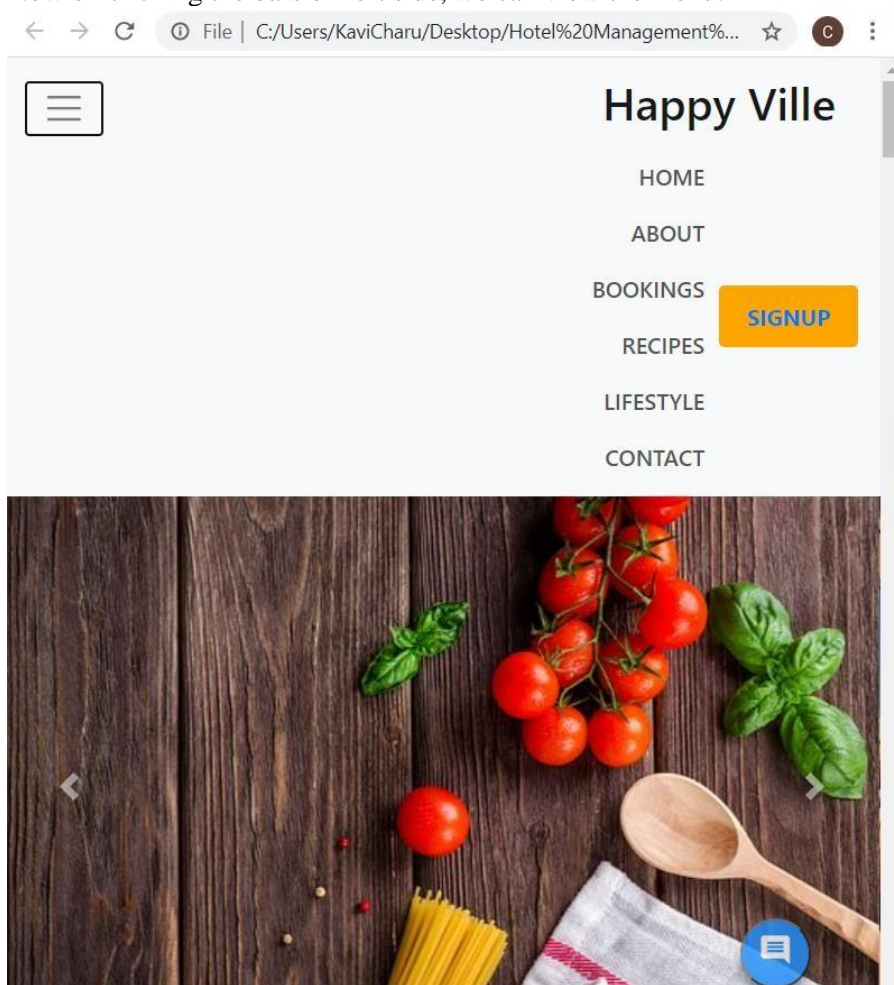

On clicking the chat button in the bottom, we get this where user can enter their feedback.

We made our website very **responsive** with the help of BOOTSTRAP as follows:

Now on clicking the bars on left side, we can view the menu:

RESULT:

In this phase of the project, we made highly responsive, user friendly, attractive website using HTML, CSS, JavaScript, Bootstrap and the output was verified successfully.
